Session 12

1. Create listings.html and update both navbars

Your folder should now contain:

pg-finder-site/

│

├── index.html

├── listings.html

├── custom.css

├── room.jpg

├── slide1.jpg

├── slide2.jpg

└── slide3.jpg

Move all six PG cards out of index.html and into listings.html. Keep the carousel and Why Choose Us section on the homepage.

Use the same navbar on both pages, but change the active link.

Navbar for index.html:

```
<nav class="navbar navbar-expand-lg navbar-dark bg-dark">
  <div class="container">
    <a class="navbar-brand" href="index.html">
      Apna PG Finder
    </a>

    <button class="navbar-toggler" type="button"
        data-bs-toggle="collapse"
```

```
        data-bs-target="#navbarMenu"
        aria-controls="navbarMenu"
        aria-expanded="false"
        aria-label="Toggle navigation">
      <span class="navbar-toggler-icon"></span>
    </button>

    <div class="collapse navbar-collapse" id="navbarMenu">
      <ul class="navbar-nav ms-auto">
        <li class="nav-item">
          <a class="nav-link active"
            aria-current="page"
            href="index.html">Home</a>
        </li>

        <li class="nav-item">
          <a class="nav-link"
            href="listings.html">Listings</a>
        </li>
      </ul>
    </div>
  </div>
</nav>
```

Navbar for listings.html:

Copy the same navbar, but make the Listings link active:

```
<li class="nav-item">
  <a class="nav-link"
```

```
    href="index.html">Home</a>
</li>

<li class="nav-item">
  <a class="nav-link active"
    aria-current="page"
    href="listings.html">Listings</a>
</li>
```

Keep the same footer on both pages.

Important: Both pages must load the same CSS file, in this order:

```
<link href="https://cdn.jsdelivr.net/npm/bootstrap@5.3.8/dist/css/bootstrap.min.css"
   rel="stylesheet">

<link rel="stylesheet" href="custom.css">
```

Both pages should also include the Bootstrap JavaScript bundle before </body> so the navbar toggler works.

2. Add the Why Choose Us section to index.html

Place this section immediately below the carousel and above the footer.

```
<section class="container py-4">
  <h2 class="text-center fw-bold mb-4">
    Why Choose Us
  </h2>

  <div class="row text-center">

    <!-- Feature 1 -->
    <div class="col-12 col-md-4 mb-3">
```

```
  <h3 class="h4 fw-bold text-primary">
    Verified Owners
  </h3>
  <p class="text-secondary">
    We check PG owners before listing.
    Find a safe and trusted place to stay.
  </p>
</div>

<!-- Feature 2 -->
<div class="col-12 col-md-4 mb-3">
  <h3 class="h4 fw-bold text-primary">
    Meals Included
  </h3>
  <p class="text-secondary">
    Enjoy comfortable accommodation with meals.
    Save time on your daily food arrangements.
  </p>
</div>

<!-- Feature 3 -->
<div class="col-12 col-md-4 mb-3">
  <h3 class="h4 fw-bold text-primary">
    Near Bus Stop
  </h3>
  <p class="text-secondary">
    Choose PG rooms near public transport.
    Make your daily travel easier.
```

```
        </p>
      </div>

    </div>
</section>
```

How the Bootstrap grid works:

Screen width	Layout
360px	Three features stacked vertically
768px	Three features in one row
1200px	Three features in one row

col-12 means full width on small screens. col-md-4 means each feature uses 4 of 12 grid columns from the medium breakpoint (768px) upwards.

3. Highlight the active navbar link in custom.css

Add this rule at the bottom of your existing custom.css:

```
/* Highlight the current page in the navbar */
.navbar.navbar-dark .navbar-nav .nav-link.active {
   border-bottom: 3px solid #123456;
}
```

This uses your existing brand colour, #123456.

The result:

- On index.html, Home has the coloured bottom border.
- On listings.html, Listings has the coloured bottom border.

You do not need separate CSS files for the two pages. Both use the same custom.css.

4. Test both pages at three screen widths

Open your website in Chrome or Edge.

1. Press F12 to open Developer Tools.
2. Press Ctrl + Shift + M to open the device toolbar.

3. Enter each width and test both pages.

Responsive testing checklist

index.html

Test at 360px: no horizontal scrollbar or overlapping content

Test at 768px: no horizontal scrollbar or overlapping content

Test at 1200px: no horizontal scrollbar or overlapping content

listings.html

Test at 360px: no horizontal scrollbar or overlapping content

Test at 768px: no horizontal scrollbar or overlapping content

Test at 1200px: no horizontal scrollbar or overlapping content

0 of 6 screen-size tests completed

What to check at each width:

Element	**Expected result**
Navbar	Collapses into a toggler on small screens
Carousel	Fits inside the screen
PG cards	Stack on mobile, form a grid on larger screens
Feature columns	Stack at 360px; appear in a row at 768px and 1200px
Footer	Stacks on mobile; shows three columns on larger screens
Images	Do not overflow their cards

If an image is too wide, add Bootstrap's img-fluid class:

<img src="room.jpg" class="card-img-top img-fluid" alt="PG room">

If your cards are in a Bootstrap grid, use:

Avoid fixed widths such as width: 600px on mobile elements. Use Bootstrap's responsive grid and utilities instead.

Save the screenshots

At 360px width:

1. Open index.html.
2. Use the device toolbar and set width to 360.
3. Open the DevTools command menu with Ctrl + Shift + P.
4. Search for Capture screenshot and select it.
5. Save the screenshot as index_360.png.
6. Repeat for listings.html, saving it as listings_360.png.

Put both screenshots in your project folder.

5. Check all links

Before pushing, test:

- Home opens index.html.
- Listings opens listings.html.
- The navbar toggler opens and closes the menu.
- All six PG cards display correctly.
- Carousel arrows and indicators work.
- Footer is visible on both pages.
- Enquiry form fields work.

6. Commit and push to GitHub

Your final folder should look like this:

pg-finder-site/

```
│
├── index.html
├── listings.html
├── custom.css
├── room.jpg
├── slide1.jpg
├── slide2.jpg
├── slide3.jpg
├── index_360.png
```

└── listings_360.png

Open the terminal inside pg-finder-site and run:

git add .

git commit -m "Integrate PG finder site"

git push origin main

Required commit message

Integrate PG finder site

Note: I can provide the code and testing steps, but I cannot directly operate your local browser, capture your screenshots, or push to your GitHub repository from this chat. If you paste your current index.html and custom.css, I can check that the changes are correctly integrated.
