1.Create a base class called SocialMediaUser with properties username and followers, and a method displayProfile() that prints the username and follower count.

JavaScript Code

```
class SocialMediaUser {
  constructor(username, followers) {
    this.username = username;
    this.followers = followers;
  }

  displayProfile() {
    console.log("Username: " + this.username);
    console.log("Followers: " + this.followers);
  }
}

let user = new SocialMediaUser("Dhruv", 1000);

user.displayProfile();
```

Output

Username: Dhruv

Followers: 1000

2.Build a YouTuber class that inherits from SocialMediaUser and adds a property channelName and a method uploadVideo(title) that prints 'Video [title] uploaded to [channelName]'.

JavaScript Code

```
class SocialMediaUser {
  constructor(username, followers) {
    this.username = username;
    this.followers = followers;
  }

  displayProfile() {
    console.log("Username: " + this.username);
    console.log("Followers: " + this.followers);
  }
}

class YouTuber extends SocialMediaUser {
  constructor(username, followers, channelName) {
    super(username, followers);
    this.channelName = channelName;
  }

  uploadVideo(title) {
    console.log("Video " + title + " uploaded to " + this.channelName);
  }
}

let youtuber = new YouTuber("Dhruv", 5000, "Dhruv Gaming");

youtuber.displayProfile();
youtuber.uploadVideo("My First Video");
```

Output

Username: Dhruv

Followers: 5000

Video My First Video uploaded to Dhruv Gaming

3.Create a Podcaster class that also inherits from SocialMediaUser and adds a property podcastName and a method publishEpisode(episodeTitle) that prints 'Episode [episodeTitle] published on [podcastName]'.

JavaScript Code

```
class SocialMediaUser {
  constructor(username, followers) {
    this.username = username;
    this.followers = followers;
  }

  displayProfile() {
    console.log("Username: " + this.username);
    console.log("Followers: " + this.followers);
  }
}

class Podcaster extends SocialMediaUser {
  constructor(username, followers, podcastName) {
    super(username, followers);
    this.podcastName = podcastName;
  }
```

```
  publishEpisode(episodeTitle) {
    console.log("Episode " + episodeTitle + " published on " + this.podcastName);
  }
}

let podcaster = new Podcaster("Dhruv", 3000, "Tech Talks");

podcaster.displayProfile();
podcaster.publishEpisode("Latest Technology");
```

Output

Username: Dhruv

Followers: 3000

Episode Latest Technology published on Tech Talks

4. Demonstrate multilevel inheritance by creating a class GamingYouTuber that inherits from YouTuber and adds a method streamGame(gameName) which prints '[username] is now streaming [gameName] on [channelName]'.

JavaScript Code

```
class SocialMediaUser {
  constructor(username, followers) {
    this.username = username;
    this.followers = followers;
  }

  displayProfile() {
    console.log("Username: " + this.username);
    console.log("Followers: " + this.followers);
```

```
  }
}

class YouTuber extends SocialMediaUser {
  constructor(username, followers, channelName) {
    super(username, followers);
    this.channelName = channelName;
  }

  uploadVideo(title) {
    console.log("Video " + title + " uploaded to " + this.channelName);
  }
}

class GamingYouTuber extends YouTuber {
  streamGame(gameName) {
    console.log(this.username + " is now streaming " + gameName + " on " +
this.channelName);
  }
}

let gamer = new GamingYouTuber("Dhruv", 10000, "Dhruv Gaming");

gamer.displayProfile();
gamer.uploadVideo("Minecraft Gameplay");
gamer.streamGame("Minecraft");
```

Output

```
Username: Dhruv
```

Followers: 10000

Video Minecraft Gameplay uploaded to Dhruv Gaming

Dhruv is now streaming Minecraft on Dhruv Gaming.

**5.Implement hierarchical inheritance by creating an InstagramInfluencer class that inherits from SocialMediaUser and adds a method postStory(storyTitle) which prints '[username] posted a new story: [storyTitle]'.

Hint: Think about how SocialMediaUser is the parent for YouTuber, Podcaster, and InstagramInfluencer.**

JavaScript Code

```
class SocialMediaUser {
  constructor(username, followers) {
    this.username = username;
    this.followers = followers;
  }

  displayProfile() {
    console.log("Username: " + this.username);
    console.log("Followers: " + this.followers);
  }
}

class InstagramInfluencer extends SocialMediaUser {
  postStory(storyTitle) {
    console.log(this.username + " posted a new story: " + storyTitle);
  }
}
```

```
let influencer = new InstagramInfluencer("Dhruv", 8000);

influencer.displayProfile();

influencer.postStory("My New Outfit");
```

Output

```
Username: Dhruv

Followers: 8000

Dhruv posted a new story: My New Outfit
```
